

Hoof Freeze

Hawthorne's Hoof Freeze aids in preventing and treating pain and soreness in horses' hooves, particularly tender-footed horses. It should be applied prior to races, competitions, or hard workouts. Hoof Freeze also combats thrush and white line disease. It is also a very effective hoof hardener.

Supplies needed:

1. Hoof Freeze.
2. Brush.
3. Hoof pick.
4. Cotton (thrush treatment).

Directions for tender footed horses:

Horse must be in a dry area. For best results, begin application at least two hours prior to race, competition or workout.

1. Using hoof pick, thoroughly clean the entire hoof area.
2. Apply to the sole of the hoof every 15 to 20 minutes.

Directions for hardening hoofs:

To harden hoofs apply Hoof Freeze daily for 1-3 days or until desired results are achieved. Caution should be used to not over-harden the hoof, which can encourage bruising and abscessing.

Do not apply Hoof Freeze on or above coronary band. If it is accidentally applied or spilled above the coronary band, clean thoroughly with soap and water, and rub in petroleum jelly to prevent irritation.

Directions for treating thrush: (see photo to the right)

1. Place cotton on frog and saturate with Hoof Freeze.
2. Gently press cotton into crevices of frog with hoof pick. Repeat treatment three times a week.
